

# **Capstone Project - 2**

# **Bike Sharing Demand Prediction**

(Supervised Machine Learning regression)

**Submitted By** 

**Bhavesh Amol Amre** 

### **Problem Statement:**

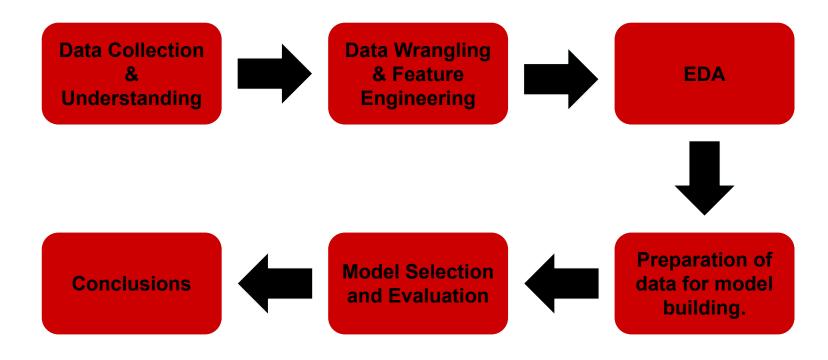

- Currently Rental bikes are introduced in many urban cities for the enhancement of mobility comfort. The client is Seoul Bike, which participates in a bike share program in Seoul, South Korea. An accurate prediction of bike count is critical to the success of the Seoul bike share program. It is important to make the rental bike available and accessible to the public at the right time as it lessens the waiting time. Eventually, providing the city with a stable supply of rental bikes becomes a major concern.
- ☐ The final aim of this project is the prediction of bike count required at each hour for the stable supply of rental bikes.

### Work Flow:

So we will divide our work flow into following steps.

### Data Collection and Understanding:

- ☐ We had a Seoul Bike Data for our analysis and model building
- The dataset contains weather information (Temperature, Humidity, Wind speed, Visibility, Dew point, Solar radiation, Snowfall, Rainfall), the number of bikes rented per hour and date information.
- ☐ In this we had total 8760 observations and 14 features including target variable.

#### **Data Description:**

- Date : year-month-day
- Rented Bike count Count of bikes rented at each hour
- Hour Hour of he day
- Temperature-Temperature in Celsius
- Humidity %
- Windspeed m/s
- Visibility 10m
- Dew point temperature Celsius
- Solar radiation MJ/m2
- Rainfall mm
- Snowfall cm
- Seasons Winter, Spring, Summer, Autumn
- Holiday Holiday/No holiday
- Functional Day NoFunc(Non Functional Hours), Fun(Functional hours)

# Check columns

### **Data Wrangling and Feature Engineering:**

- As we know we had 8760 observations and 14 features.
- ☐ Categorical Features: Seasons, Holiday and Functioning day.
- **Numerical Columns:** Date, Hour, Temperature, Humidity, Wind speed, Visibility, Dew point temperature, Solar radiation, Rainfall, Snowfall, Rented Bike count.

**Rename Columns:** We renamed columns because they had units mentioned in brackets and was difficult to copy the feature name while working.

### **Data Wrangling and Feature Engineering:**

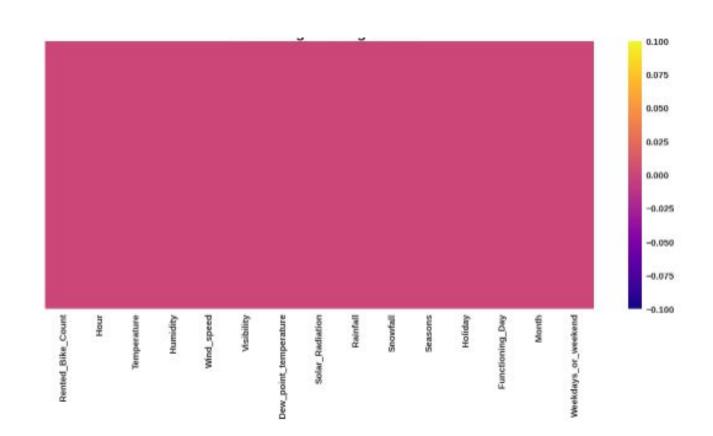

- We had zero null values in our dataset.
- Zero Duplicate entries found.
- We changed the data type of Date column from 'object' to 'datetime64[ns]'. This was done for feature engineering.
- We Created two new columns with the help of Date column 'Month' and 'Day'. Which were further used for EDA. And later we dropped Date column.

```
# check for Null values in our bike data
# as we can see we don't have any null values.
bike df.isnull().sum()
Rented Bike Count
Hour
Temperature
Humidity
Wind speed
Visibility
Dew point temperature
Solar Radiation
Rainfall
Snowfall.
Seasons
Holiday
Functioning Day
Month
Weekdays_or_weekend
dtype: int64
```

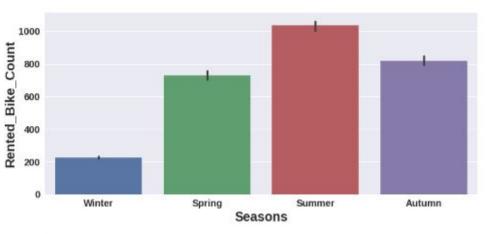

```
# Change The datatype of Date columns to extract 'Month','Day', "year".
bike_df['Date']=bike_df['Date'].astype('datetime64[ns]')

# Creating new columns 'Month', 'Year','Day.
bike_df['Month']=bike_df['Date'].dt.month
bike_df['Day']=bike_df['Date'].dt.day_name()
```

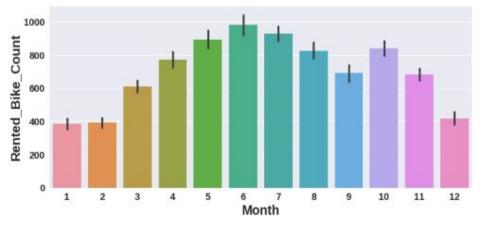

# Relation of rented bike count with categorical features:

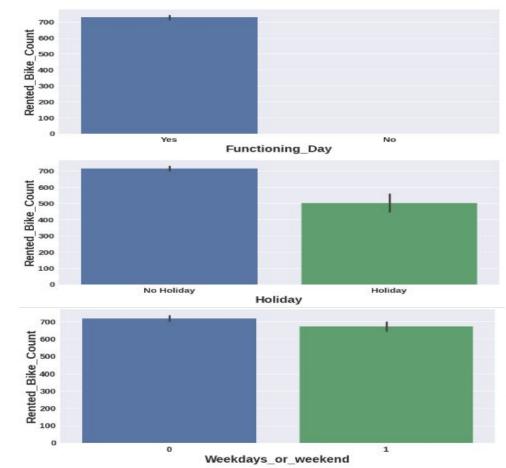

Summer season had the highest Bike Rent Count. People are more likely to take rented bikes in summer. Bike rentals in winter is very less compared to other seasons.

From March Bike Rent Count started increasing and it was highest in June. It was lowest in January and February.

Zero Bikes were rented on no functioning day. More than 700 bikes rented on functioning day.

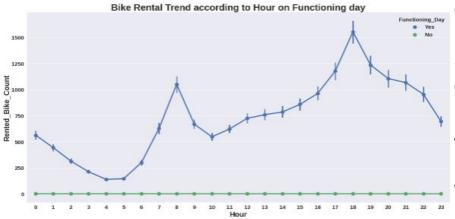

More than 700 bikes were rented on No Holidays and almost 500 bikes were rented on Holidays

More than 700 bikes were rented on weekdays. On weekends, almost 650 bikes were rented.

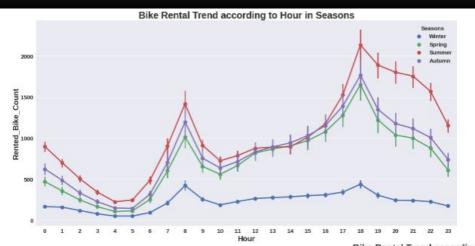

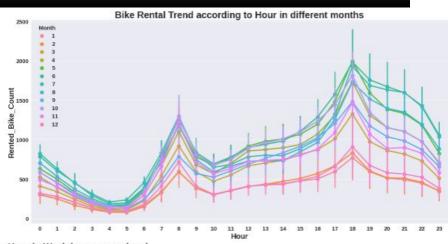

# Bike Rent Trend according to hour in different scenarios:

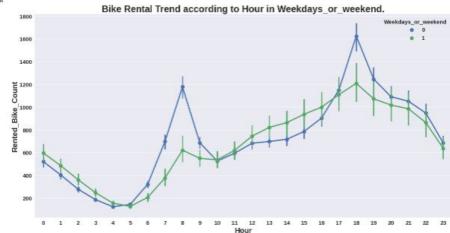

- 1)Here we observed that, Bike rental trend according to hours is almost similar in all scenarios.
- 2)There is sudden peak between 6/7AM to 10 AM. Office /College going time could be the reason for this sudden peak on NO Holiday. But on Holiday the case is different, very less bike rentals happened.
- 3) Again there is peak between 4PM to 7 PM. may be its office leaving time for the above people.( NO Holiday).
- 4)Here the trend for functioning day is same as of No holiday. Only the difference is on No functioning day there were zero bike rentals.

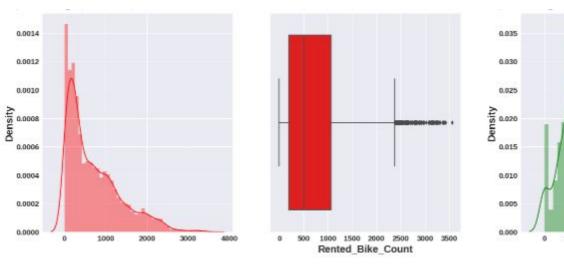

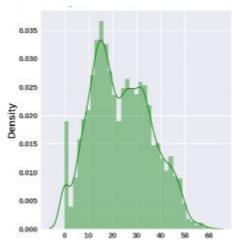

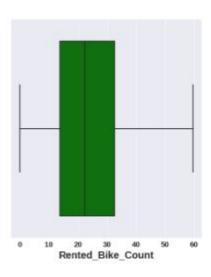

#### Distribution of target variable- Bike Rent Count

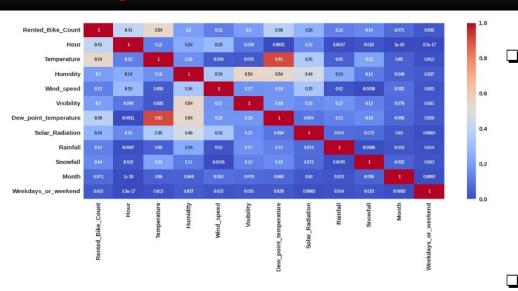

Distribution is rightly skewed and some outliers are observed.

To normalize the distribution we applied square root method. After normalization no outliers were found.

### Preparation of data for model building:

With the help of heat map we can see
Temperature and Dew point temperature are
91 % correlated. So we dropped the Dew point
temperature because it has very low correlation
with our target variable as compared to
temperature.

Calculate\_vif(df[[i for i in df.describe().columns if i not in ['Rented\_Bike\_Count']]])

By using variation inflation factor we dropped 'Visibility' and 'Humidity' features as they had VIF value more than 5.

# Labeling for holiday=1 and no holiday=0
df['Holiday']=df['Holiday'].map({'No Holiday':0, 'Holiday':1})

# # Labeling for Yes=1 and no No=0
df['Functioning\_Day']=df['Functioning\_Day'].map({'Yes':1, 'No':0})

- We have created dummy variables for categorical Seasons column and did mapping with 0 and 1 for holiday and functioning column.
- Thus we prepared our data for model building.

As this is the regression problem we are trying to predict continuous value. For this we used following regression models.

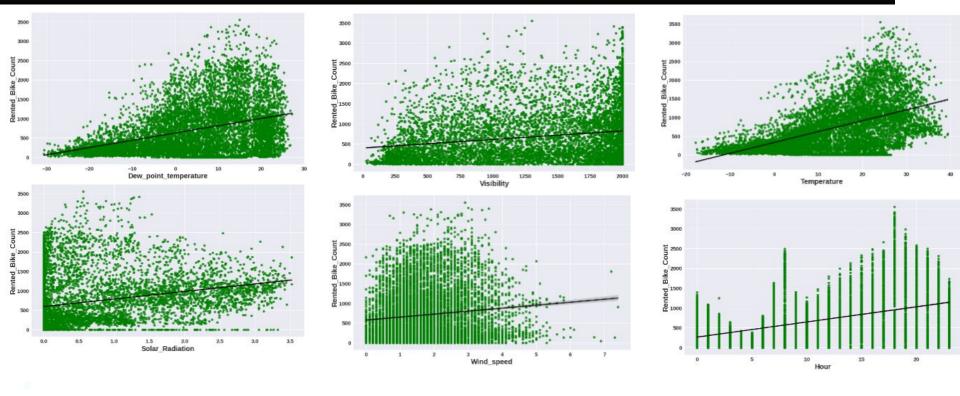

- Linear Regression
- Lasso regression (regularized regression)
- Ridge Regression(regularized regression)
- Decision Tree regression.
- Random forest regression
- Gradient Boosting regression.

#### **Assumptions of regression line:**

- 1. The relation between the dependent and independent variables should be almost linear.
- 2. Mean of residuals should be zero or close to 0 as much as possible. It is done to check whether our line is actually the line of "best fit".
- 3. There should be homoscedasticity or equal variance in a regression model. This assumption means that the variance around the regression line is the same for all values of the predictor variable (X).
- 4. There should not be multicollinearity in regression model. Multicollinearity generally occurs when there are high correlations between two or more independent variables.
- Before and after applying these models we checked our regression assumptions by distribution of residuals, scatter plot of actual and predicted values, removing multi-colinearity among independent variables.

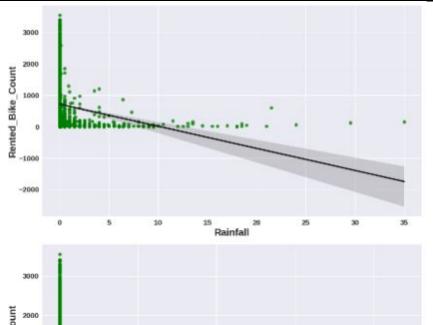

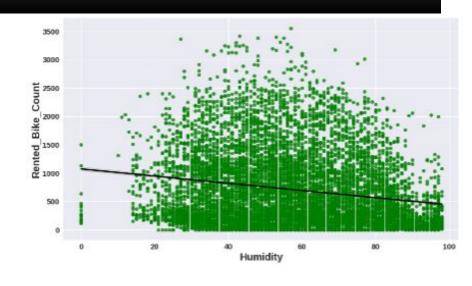

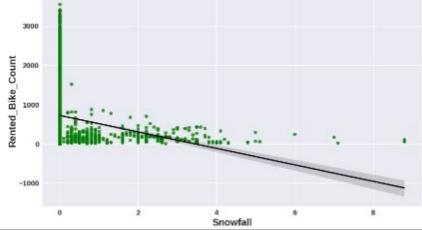

From the above regression plot of all numerical features we see that the columns 'Temperature', 'Wind\_speed', 'Visibility', 'Dew\_point\_temperature', 'Solar\_Radiation' are positively relation to the target variable, which means the rented bike count increases with increase of these features.

 'Rainfall',' Snowfall', 'Humidity' these features are negatively related with the target variable which means the rented bike count decreases when these features increase.

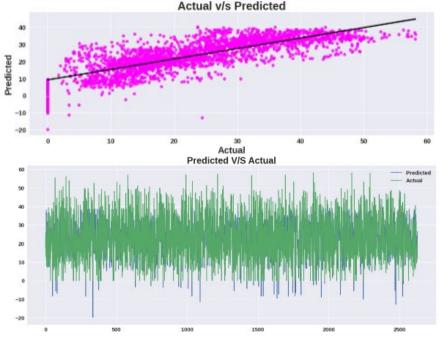

#### ➤ Linear Regression

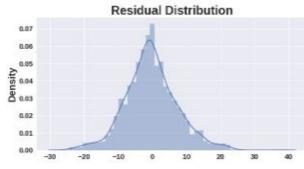

#### **Scores on Train Set**

The Mean Absolute Error (MAE) is 5.8555397241788345. The Mean Squred Error(MSE) is 60.29949292444555. The Root Mean Squared Error(RMSE) is 7.765274813195316. The R2 Score is 0.6123528085603556.

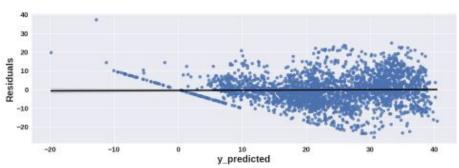

#### **Scores on Test Set**

The Mean Absolute Error (MAE) is 5.834169822951748. The Mean Squred Error(MSE) is 58.624247223024895. The Root Mean Squared Error(RMSE) is 7.656647257319936. The R2 Score is 0.618326967365199.

Mean of residuals should be zero or close to 0 as much as possible. It is done to check whether our line is actually the line of "best fit"

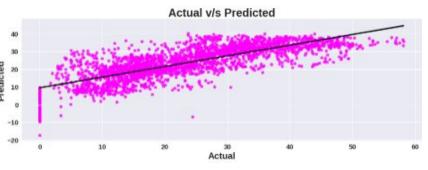

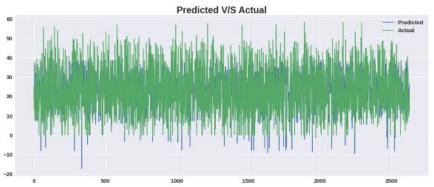

#### ➤ Lasso (Hyper-parameter tuned- alpha=0.01)

#### **Scores on Train Set**

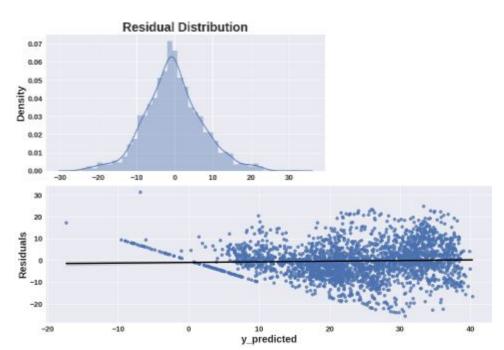

The Mean Absolute Error (MAE) is 5.869103531726283. The Mean Squred Error(MSE) is 60.46402436494349. The Root Mean Squared Error(RMSE) is 7.775861647749624. The R2 Score is 0.6112950857219155.

#### **Scores on Test Set**

The Mean Absolute Error (MAE) is 5.850566426263689. The Mean Squred Error(MSE) is 58.792684087499225. The Root Mean Squared Error(RMSE) is 7.667638755673042. The R2 Score is 0.61723035952942.

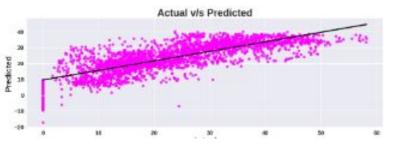

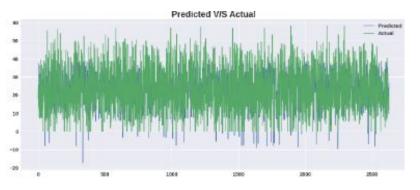

#### Ridge (Hyper-parameter tuned- alpha=0.1)

#### **Scores on Train Set**

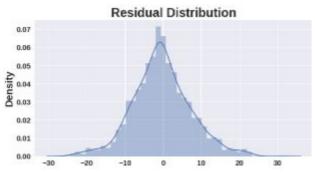

The Mean Absolute Error (MAE) is 5.869103531726283.
The Mean Squred Error(MSE) is 60.46402436494349.
The Root Mean Squared Error(RMSE) is 7.775861647749624.
The R2 Score is 0.6112950857219155.

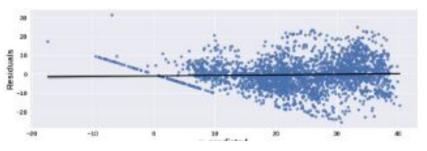

#### **Scores on Test Set**

The Mean Absolute Error (MAE) is 5.850566426263689.
The Mean Squred Error(MSE) is 58.792684087499225.
The Root Mean Squared Error(RMSE) is 7.667638755673042.
The R2 Score is 0.61723835952942.

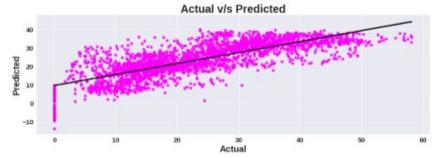

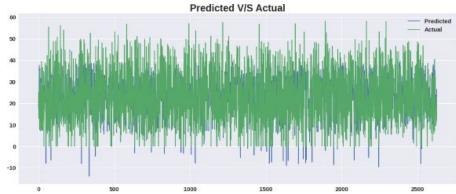

#### ➤ Elastic Net (Hyper-parameter tuned- alpha=0.001,l1\_ratio=0.5)

#### **Scores on Train Set**

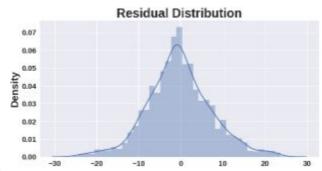

The Mean Absolute Error (MAE) is 5.8932275545714745.
The Mean Squred Error(MSE) is 60.90273656811195.
The Root Mean Squared Error(RMSE) is 7.804020538678249.
The R2 Score is 0.6084747377362095.

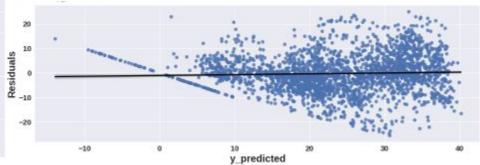

#### **Scores on Test Set**

The Mean Absolute Error (MAE) is 5.871068266349744. The Mean Squred Error(MSE) is 59.2908889405223. The Root Mean Squared Error(RMSE) is 7.700057723194178. The R2 Score is 0.6139867979293316.

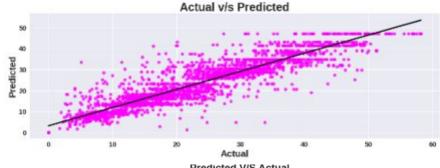

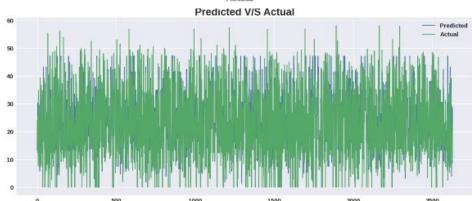

#### Decision Tree regression(Hyper-parameter tuned- max\_depth=9,max\_features='auto') **Scores on Train Set**

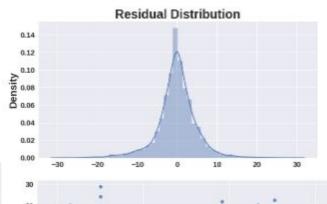

The Mean Absolute Error (MAE) is 2.88551652156907. The Mean Squred Error(MSE) is 18.444625087726916. The Root Mean Squared Error(RMSE) is 4.294720606480347. The R2 Score is 0.8814250872495163.

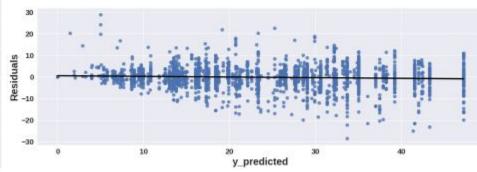

#### **Scores on Test Set**

The Mean Absolute Error (MAE) is 3.4002565420161455. The Mean Squred Error(MSE) is 24.817920688776965. The Root Mean Squared Error(RMSE) is 4,981758794720692. The R2 Score is 0.8384229819286246.

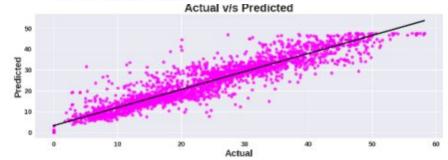

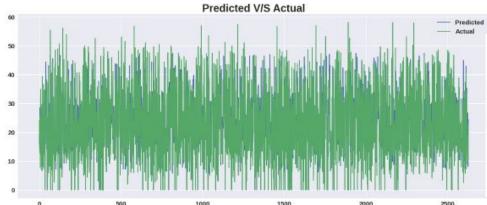

#### Random forest regression(Hyper-parameter tuned- 'max\_depth': 9, 'n\_estimators': 100')

#### **Scores on Train Set**

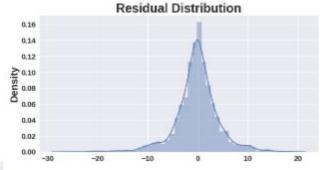

The Mean Absolute Error (MAE) is 0.9345843358603537. The Mean Squred Error(MSE) is 2.1471902150699127. The Root Mean Squared Error(RMSE) is 1.4653293879090505. The R2 Score is 0.9861963639163357.

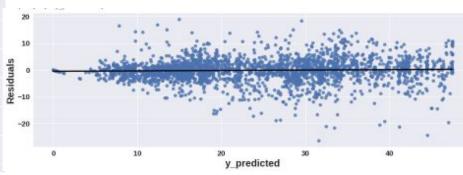

#### **Scores on Test Set**

The Mean Absolute Error (MAE) is 2.4848219543742553. The Mean Squred Error(MSE) is 14.378311632853338. The Root Mean Squared Error(RMSE) is 3.791874422083798. The R2 Score is 0.9063900337312304.

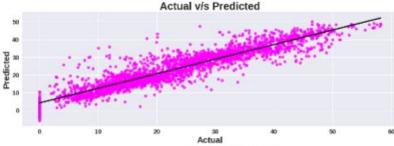

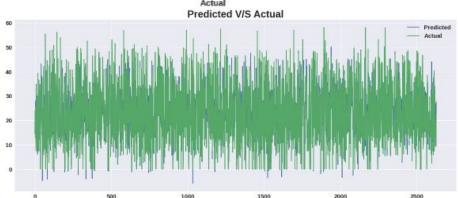

# Gradient boosting regression(Hyper-parameter tuned- 'learning\_rate': 0.04, 'max\_depth': 8, 'n\_estimators': 150, 'subsample': 0.9)

#### **Scores on Train Set**

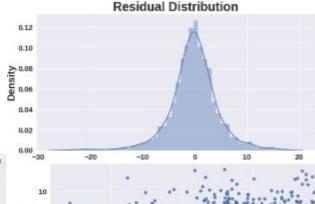

The Mean Absolute Error (MAE) is 3.1772012244215926.
The Mean Squred Error(MSE) is 20.527734615794035.
The Root Mean Squared Error(RMSE) is 4.530754309802512.
The R2 Score is 0.86803340650971.

#### **Scores on Test Set**

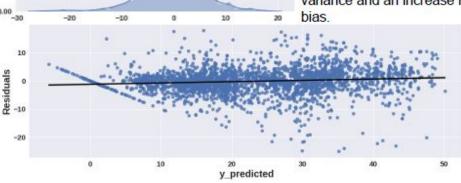

The Mean Absolute Error (MAE) is 3.2844768655830294.
The Mean Squred Error(MSE) is 21.683270954542017.
The Root Mean Squared Error(RMSE) is 4.656529926301561.
The R2 Score is 0.8588311121304812.

➤ Learning rate shrinks the contribution of each tree by learning\_rate. There is a trade-off between learning\_rate and n\_estimators.

➤ Choosing subsample < 1.0

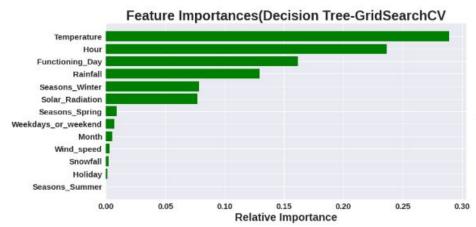

Choosing subsample < 1.0 leads to a reduction of variance and an increase in bias.</p>

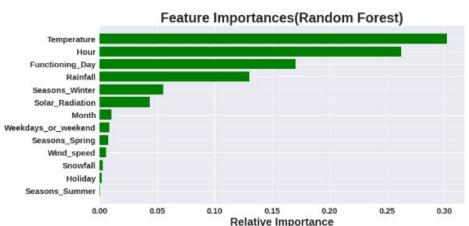

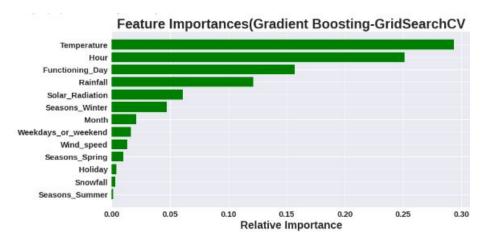

### Feature importance's :

From all the 3 models we can see that temperature, hour, functioning day are the top three important features among all the features.

### **Conclusion:**

Model

							, ,
Training set	0	Linear Regression	5.8555	60.2995	7.7653	0.6124	Our assumption: if the difference of R2 score between Train data and Test is more than 5 % we will consider it as over fitting.  Linear, Lasso, Ridge and Elastic Net: Linear, Lasso, Ridge and Elastic regression models have almost similar R2 scores(61%) on both training and test data.(Even after using GridserachCV we have got similar results as of base models).  Decision Tree Regression: On Decision tree regressor model, without hyper-parameter tuning, we got r2 score as 100% on training data and on test data it was very less. Thus our model memorized the data. So it was a over fitted model. After hyper-parameter tuning we got r2 score as
	1	Lasoo	5.8691	60.4640	7.7759	0.6113	
	2	Ridge GridSearchCV	5.8691	60.4640	7.7759	0.6113	
	3	ElasticNet(GridSearchCV-Tunned)	5.8932	60.9027	7.8040	0.6085	
	4	Decision Tree Regressor-GridSearchCV	2.8855	18.4446	4.2947	0.8814	
	5	Random Forest	0.9346	2.1472	1.4653	0.9862	
	6	Random Forest-GridSearchCv	2.6326	14.9684	3.8689	0.9038	
	7	Gardient boosting Regression	3.1772	20.5277	4.5308	0.8680	
	8	Gradient Boosting Regression(GridSearchCV)	3.1772	20.5277	4.5308	0.8680	
3 4 5	0	Linear Regression	5.8342	58.6242	7.6566	0.6183	
	1	Lasso	5.8506	58.7927	7.6676	0.6172	
	2	Ridge(GridsearchCv Tunned)	5.8506	58.7927	7.6676	0.6172	
	3	ElasticNet(GridSearchCV-Tunned)	5.8711	59.2909	7.7001	0.6140	
	4	Decision Tree Regressor(GridsearchCV)	3.4003	24.8179	4.9818	0.8384	
	5	Radom forest	2.4848	14.3783	3.7919	0.9064	
	6	Gradient Boosting Regression	3.2845	21.6833	4.6565	0.8588	
	7	Gradient Boosting Regression(GridSearchCV)	3.2845	21.6833	4.6565	0.8588	88% on training data and 83% on test data which is quite good for us.

RMSE R2\_score As we have calculated MAE, MSE, RMSE and R2 score

### **Conclusion:**

#### **Random Forest:**

On Random Forest regressor model, without hyper-parameter tuning we got r2 score as 98% on training data and 90% on test data. Thus our model memorized the data. So it was a over fitted model, as per our assumption After hyper-parameter tuning we got r2 score as 90% on training data and 87% on test data which is very good for us.

#### **Gradient Boosting Regression(Gradient Boosting Machine):**

On Random Forest regressor model, without hyper-parameter tuning we got r2 score as 86% on training data and 85% on test data. Our model performed well without hyper-parameter tuning. After hyper-parameter tuning we got r2 score as 96% on training data and 91% on test data, thus we improved the model performance by hyper-parameter tuning.

Thus Gradient Boosting Regression(GridSearchCV) and Random forest(GridSearchCv) gives good r2 scores. We can deploy this models.

# **THANK YOU**
